

Installation Guideline

INS5001

Proper Recorder Angle

Application:

All DVXC4 Installations

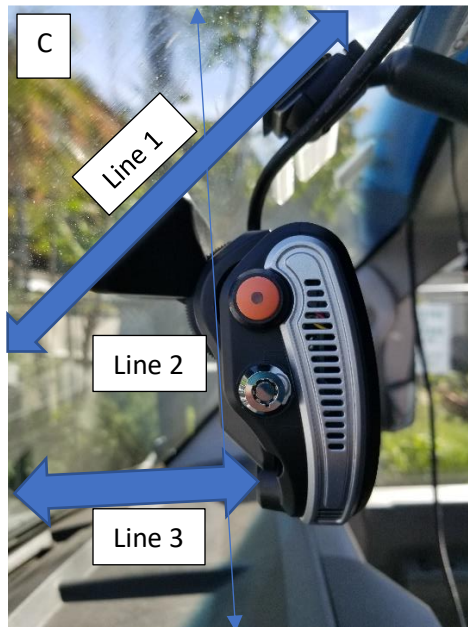

Make sure the VHB tape Guideline was followed before mounting and adjusting the recorder

The photo below shows the perfect mounting angle of the DVXC4

The above photos (A & B) are the recording images of this exact camera and angle (Photo C). Notice the visual of the vehicles hood (Photo A). Not viewing the hood will give you too much view of the sky and the possibility of missing an event that takes place in front of the vehicle.

This angle also gives you the perfect visual of the driver inside the vehicle.

Line 1 represents the angle of the windshield. Line 2 represents the recorder angle. Line 3 represents the location of the lens. Notice line 2 is slightly angled. This is to capture the front of the vehicle.

Depending on the vehicle and angle of the windshield, mounting the recorder straight may not give you a complete visual of the front of the vehicle. Always push the driver event button & verify activity and proper viewing angle after your installation is complete.
